

Summer Maintenance Made Easy

Drs. Foster & Smith Educational Staff

stay on top of aquarium maintenance

Just because you are on vacation this summer does not mean your aquarium maintenance can take a break. There are a number of ways you can keep up the regular maintenance and testing of your aquarium during the fun-filled summer months.

Use [automatic feeders](#) to make sure your aquariums are receiving the vital nutrients necessary when you are away this summer. Battery-driven automatic feeders deliver food reliably, work right through power failures, and deliver pre-calibrated amounts to avoid overfeeding. Test it at least two weeks in advance of your trip, for three or more days. This will accustom your fish to the feeder, and assure you that it is operating properly.

Incorporate [programmable timers](#) to keep your aquarium lights operating on a natural light cycle. Programmable timers can help you and your aquariums get used to a natural cycle that isn't affected by your summer plans. Select a timer that is rated to meet the demands of your particular light setup and make sure it is on the recommended 10-12 hours per day.

How can I make water changes easier?

A. Upgrade your siphon to the [Aqueon Aquarium Water Changer](#) which can be attached to any faucet to suction-clean gravel and refill your aquarium with fresh, clean water.
