 - From lakes
 - From food
 - From a water bottle
 - From snow
- What type of small animal can sort-of fly?
 - Sugar glider
 - Gerbil
 - Hamster
 - Rat

Answer Key

1. **D. Hedgehog**
They have strong muscles that act as a drawstring to pull their skin tight around their sides and down over their feet and head when frightened. This "rolls" the hedgehog into a spiny ball.
2. **B. Fur**
As chinchillas roll and frolic in special grooming sand or dust, they remove excess oils and moisture to keep their velvety-soft fur healthy and clean.
3. **D. Corner**
Ferrets tend to back up into a corner when going to the bathroom. Be sure the corner litter box is big enough so all of your ferret can fit inside of it.
4. **B. Kangaroo**
Sugar gliders are marsupials, like kangaroos and wombats.
5. **B. Awake at Night**
Nocturnal animals sleep during the day and are active at night.
6. **A. Plants**
Herbivores eat plants, carnivores eat meat, and omnivores eat both plant and animal products.
7. **D. Pouch**
Female marsupials have a pouch in which they carry and nurse their young.
8. **A. Multi-functional**
The best treats taste great and also satisfy your pet's natural instinct (to chew or nest) or are nutritious. Know what treats are best for your pet. For example, rats need low fat treats, and ferrets should have treats high in protein.
9. **B. From Food**
Gerbils are adapted to life in desert regions and obtain almost all of their needed water from the natural foods that make up their diet. But having fresh drinking water available to your pet gerbil is still necessary to quench her occasional water needs.
10. **A. Sugar Gliders**
With a skin fold that stretches between their front and back legs, these tiny animals can catch air like a parachute and glide over 150 feet through the air.
