

Suet: An Ideal Bird Food for Spring and Summer

Drs. Foster & Smith Educational Staff

SUET IN THE SUMMERTIME?

You bet! In fact, suet is ideal year round. This high-protein, high-calorie, pure animal fat enhances any backyard menu with outstanding nutrition and flavor.

ENERGY TO THRIVE AND SURVIVE

[Suet](#) is very high in fat, a super-concentrated form of energy. Because birds have extremely fast metabolisms, they quickly burn calories. Suet is perfect for sustaining birds' energy and activity levels. In spring, it gives breeding birds the extra energy they need to build nests, then care for young. And in summer, suet offers insect-eaters a tasty substitute, especially in years when insects are sparse.

CONSISTENT FIRMNESS - EVEN IN THE SUN

Formulation improvements have created suet that won't melt. While the suet of yesteryear melted and spoiled in high heat and/or direct sun, today's varieties, such as [Never Melt Suet](#), stand up to summer weather, stay fresh, and maintain nutritional potency. This longerlasting suet also maximizes your investment.

ESSENTIAL FEEDING VARIETY

Suet switches up backyard birds' day-to-day diet. When offered alongside [seed feeders](#), suet brings birds new textures, tastes, and favorite ingredients like fruits, vegetables, and insects.

SIMPLE BIRD FEEDING

What could be easier than dropping a suet cake into a feeder? A wide variety of styles – [plugs](#), [balls](#), and [cakes](#) – and their accompanying [feeders](#) let you fill and feed in no time. Plus, [Suet Plus Blend Cakes](#) slide right out of the package, keeping your fingers completely clean!
