

Plant-Eating Fish Nutrition

Drs. Foster & Smith Educational Staff

With the wide variety of high-quality prepared [food](#) items now available, it is easier to provide a proper diet for your aquarium inhabitants. However, unless you provide the correct diet for your species, the quality of the food will not matter and your fish will experience the effects of nutritional deficiencies, such as weight loss, weakened immune system, and a greater susceptibility to illnesses.

Though all fish and invertebrates benefit from some vegetable matter as part of their diet, herbivores or plant-eaters require vegetable matter to thrive. Oftentimes, the algae growing on the side of your aquarium is not enough and their diet needs to be supplemented. Vegetable foods such as [Seaweed](#) and [Spirulina Pellets](#) provide the necessary vitamins, minerals, vegetable proteins, and amino acids for proper growth and a healthy immune system.

Selection

Prepared vegetable food is available in [flake](#), [pellet](#), [tablet](#), [wafer](#), and [sheet](#) forms. These varieties target the specific feeding habits of different fish and invertebrates.

- **Flakes and pellet foods** - Excellent for surface and mid-water feeders.
- **Tablets and wafers** - Designed to sink for bottom feeders and scavengers.
- **Seaweed sheets** - Secured with a feeding clip, mimics natural feeding conditions for grazers and pickers.

With a varied diet including vegetable foods that meets the particular feeding habits of your fish or invertebrates, your aquarium inhabitants will demonstrate a new and long-lasting vitality.
