

## Small Pet Safety: Common Household Hazards

*Drs. Foster & Smith Educational Staff*

The following items are all dangerous to some degree if ingested, nibbled, or placed in contact with your pet. Some can cause death almost instantly. Others may cause only a mild reaction, but it is best to remove them from any areas where they would be in contact with your small pet.

This is not a complete list, so if you are in any doubt about something that your pet has eaten or been in contact with, please contact your veterinarian or the [National Animal Poison Control Center](http://www.nationalpoisoncenter.org) at (888) 426-4435.

### Common hazards to avoid:
